STANDARD DETAIL SPECIFICATIONS
FOR
STREET CONSTRUCTION, WALKWAYS, AND PAVEMENT RESTORATION

CITY OF EDEN PRAIRIE, MINNESOTA

(A Supplement to MnDOT Standard Specifications for Construction)

1. **PAVEMENT REMOVAL AND RESTORATION**

Where the existing bituminous surface is disturbed, it shall be restored with new pavement of equal thickness to the existing pavement by the Contractor. The minimum thickness shall be as specified in the Special Conditions or Plans.

Prior to aggregate base and bituminous restoration, saw cut the existing bituminous a minimum of two (2) inches deep and one (1) foot from the edge of the trench. The pavement shall be removed to expose a one (1) foot width of undisturbed aggregate base. Materials resulting from the removal shall be disposed of by the Contractor at locations outside the right-of-way.

Payment for pavement removal shall be made by the square yard of pavement removed. Payment for pavement restoration shall be made by the appropriate bid items for bituminous roadway construction. When payment is by surface square yard, it shall be full compensation for the thickness indicated in the Plans. Saw cutting shall be paid for as described in the Special Provisions for concrete and bituminous surfaces.

2. **STREET CLEANING**

It shall be the Contractor's responsibility to thoroughly clean any bituminous surface prior to applying the tack coat for all subsequent "lifts" of bituminous required to achieve the typical pavement section. A pick-up type sweeper shall be used to minimize dust and debris and to assure a good bond between the succeeding layers of bituminous and the tack coat. All street areas within and adjacent to the project shall be kept clean in accordance with the City's "Erosion Control Policy", which shall be obtained by the Contractor prior to construction.

3. **MANHOLE AND VALVE BOX ADJUSTMENT**

All manhole castings and valve boxes located in the street section shall be installed 1/2" below the base course grade during the freeze-thaw cycle to allow for accessibility. Prior to the placement of the final wearing course, the Contractor has the option of either raising the structure to its proper grade (1/2" below finished grade) with plastic adjusting rings or installing an approved casting adjustment ring (Neenah R-1979 Series or approved equal for 1-1/2" wearing course), which will raise the casting the same dimension as the wearing course. An approved epoxy adhesive shall be used to set the casting adjustment ring in place. Two-piece metal adjusting rings will not be allowed.

Catch basin castings shall be adjusted to their final grade at the time the curb is installed and shall be protected by the Contractor using temporary patches or blisters. These patches or blisters shall be removed prior to placement of the final wearing course. Any structure adjustments, materials or adjustment rings needed to obtain the proper grade adjustments shall be incidental to the project cost.

4. AGGREGATE BASE

The aggregate base shall be placed in accordance with MnDOT 2211 and may be virgin materials or recycled materials and must meet MnDOT requirements for Class 5.

Class 5 aggregate base or other approved base material placed under concrete curb and gutter shall be considered incidental unless approved by the Engineer or shown on the typical section of the Plans.

Compaction of the Class 5 aggregate base shall be obtained by the "Specified Density Method". Compaction of the recycled Class 5 shall meet the Penetration Index Method requirements.

5. STREET DEFLECTION TESTING

The Contractor will furnish a tandem truck loaded with a minimum of 14 tons to check the completed subgrade and/or base. This truck will be driven in any locations the Engineer may direct to determine if any soft spots exist so that these areas may be removed and replaced with satisfactory material before completing subgrade or base preparation. Cost of furnishing the loaded truck and driver shall be incidental to construction of the subgrade and/or base and no direct compensation will be made therefore.

Prior to the deflection testing, a representative from the City of Eden Prairie Engineering Division shall be scheduled a minimum of 24 hours in advance so as to observe the testing.

6. PLANT MIXED BITUMINOUS PAVEMENT

The bituminous plant mix shall meet the requirements of MnDOT Specification 2360 or its latest revision. The Contractor may be required to submit to the Engineer a job mix formula prepared by an independent testing laboratory, including the exact proportions of bituminous material and mineral filler. The Contractor shall pay for all samples, reports and tests required to develop the job mix.

A plant mixed bituminous pavement shall be prepared using the following minimum design standards for wear and non-wear surfaces:

	>3" (Non-Wear)	1-1/2"-3" (Non-Wear)	1-1/2" or Less (Wear)
AADT < 2,300	SPNWB230C	SPNWB230C	SPWEA240C
AADT < 2,300 to < 6,000	SPNWB330C	SPNWB330C	SPWEA340C
AADT < 6,000	SPNWB430C	SPNWB430C	SPWEA440C
NOTE: These minimum standards may be modified by the Engineer where traffic and weather conditions warrant and as approved by the City Engineer.			

For overlay construction, bituminous pavement design shall utilize B (PG 58S-28) oil. Driveways will use SPWEA240C placed in one lift, 3-inches thick.

Bituminous tack coat shall be applied to existing bituminous surfaces and to successive plant mix surfaces in accordance with MnDOT 2357.

Asphalt binder material (MnDOT 3151) shall meet the requirement of PG asphalt binder testing tolerances based on the most current MnDOT Technical Memorandum titled "Inspection, Sampling, and Acceptance of Bituminous Materials." The temperature of the bituminous material at the time of application shall be as approved by the Engineer, within the limits specified by the manufacturer. However, in cases where "Ordinary Compaction" is implemented, the minimum lay down temperatures of the mix shall be in accordance with MnDOT specification 2360.3.D.2, Table 2360.3-4 Minimum Temperature Control. Areas under ordinary compaction include bike paths, walking paths and other non-traffic areas.

Compaction requirements for the "Maximum Density Method", as set forth in MnDOT specification 2360.3.D.1, Table 2360.3-1 Required Minimum Lot Density (Mat), shall be implemented. No HMA shall be laid when the temperature is below 32 degrees F. unless directed by the Engineer. No payment incentives will be paid to the Contractor.

At the direction of the Engineer, the Contractor (or testing firm) shall cut or core samples from any bituminous pavement within the scope of the Project or Contract. The number of cores taken shall be in accordance with MnDOT specification 2360.3.D.1.h, Table 2360.3-3 Lot Determination. These samples will be taken at locations designated by the Engineer, by sawing with a power driven masonry saw or diamond core drill. Samples shall be sufficiently large to meet the needs of the testing laboratory. Costs of testing the samples will be paid by the Owner, except retests for failed tests shall be at the Contractor's expense. The surfaces from which samples are taken shall be restored by the Contractor no later than the next succeeding day of plant operation. All test results will be available to the Contractor.

7. BITUMINOUS WEARING COURSE

The bituminous wearing course shall not be installed until the following conditions have been met:

- A. After one (1) freeze-thaw cycle since the bituminous base course has been installed unless approved by the City Engineer.
- B. The watermain, storm sewer, sanitary sewer, and street sections (including sidewalks, trails, and all adjacent areas to the project) have been final inspected and all noted deficiencies corrected.

8. CONCRETE

Concrete shall meet the requirements of MnDOT Specification 2461, 2521, 2531, 2533 and City Detail Drawings.

9. PEDESTRIAN CURB RAMPS

Pedestrian curb ramps shall be installed at all trail and sidewalk crossings in accordance with MnDOT Standard Plans 5-297.250 Pedestrian Curb Ramp Details (sheets 1-6) and Truncated Domes Standard Plate 7038 or latest revision.

10. TEMPORARY TURN-AROUNDS

Temporary turn-arounds shall be constructed in accordance with Detail Drawing R-18.

11. RETAINING WALLS

This work shall consist of constructing dry cast modular block retaining walls (small block walls) and precast or wetcast modular block retaining walls (large block walls) both with and without soil reinforcement in conformity with the lines, grades, standards, design, details and dimensions shown on the plans or otherwise established or as directed by the Engineer.

The Contractor shall submit shop drawings and the manufacturer's suggested installation procedure showing materials and construction methods to the Engineer for approval prior to beginning any retaining wall work. Construction limits, as shown on the plans, shall be strictly observed. It shall be the Contractor's responsibility to verify that the proposed wall system, including geogrid placement (if necessary), remains within the construction limits. Timber or boulder retaining walls shall not be permitted in the right-of-way or on public property without the express written permission of the City Engineer.

Geogrid Reinforcement

Geogrid reinforcement shall be furnished and installed in accordance with the manufacturer's specifications and recommendations for the retaining wall system used and as directed by the Engineer.

Drainage Systems

Drainage system for the retaining walls shall be furnished and installed according to manufacturer's specifications. It shall be the Contractor's responsibility to ensure that any drainage system installed behind any wall is properly discharged either into the proposed storm sewer system or daylighted downgrade of the wall.

Fencing

Unless otherwise specified, fencing above a retaining wall shall be black vinyl chain link 60" in height or vinyl split rail style or approved equal by the City Engineer. Fencing may be fixed to the large block retaining walls or installed behind the face of the wall with posts encased in concrete footings as required by manufacturers recommendations. Space between fence and face of the wall shall be steel edging holding back Type 9 aggregate mulch over a weed barrier fabric. Fence shall be located in rock mulch.

Small Block Walls

Small block walls are to be used for any public retaining wall less than four feet (4') exposed height. Private walls over 4' exposed height require a building permit. See standard detail R-20. Only blocks from the MnDOT approved list will be allowed.

Small block walls shall consist of non-reinforced 8-inch-tall units.

The small block wall units shall be straight faced and tan in color with an approved pattern.

Small block walls shall be constructed as shown in the standard detail and as required by the manufacturer's specifications and in accordance with the following:

Excavation and Backfill

The Contractor shall excavate to the lines and grades shown on the construction drawings or as required by the manufacturer's specifications for constructing the wall. Excavation and backfill required for retaining wall construction shall be incidental to the unit price of the wall. Over excavation and additional compacted backfill shall not be paid for unless directed by the Engineer.

The Contractor shall be careful not to disturb embankment materials and foliage beyond lines shown or as directed by the Engineer. All tree roots encountered during excavation larger than 1-1/2 inch shall be cut vertically with a pruning saw, leaving as much of the root intact as possible.

Landscape ground cover shall be removed and stockpiled at the top of the slope and maintained. Upon completion of the retaining wall, the ground cover shall be spread uniformly over the disturbed area to restore it to its original appearance.

Foundation Soil Preparation

The foundation soil shall be excavated as shown in the standard detail or as required by the manufacturer's specifications or as directed by the Engineer.

Foundation soil shall be examined to assure that the actual foundation soil strength meets or exceeds assumed design strength for the retaining wall system to be constructed. Soils not meeting required strength shall be removed and replaced with acceptable material at the direction of the Engineer.

Over-excavated areas shall be filled with compacted backfill material.

Foundation

Footing materials (6" aggregate base class 5) shall be installed upon undisturbed in situ soils or compacted replacement backfill material.

The material shall be compacted to provide a level hard surface on which to place the first course of units. Compaction shall be by mechanical plate compactors to 95 percent of standard proctor density.

The footing shall be prepared to ensure complete contact of retaining wall unit with base. Gaps shall not be allowed.

Footing materials shall be to the depths and widths shown in the Plans or in accordance with the manufacturer's specifications.

Unit Installation

The units shall be installed according to the manufacturer's specifications and as directed by the Engineer.

Backfill shall be placed as per the manufacturer's specifications and compacted as each course is completed. A minimum of 12 inches of drainage aggregate (3/8" clear crushed rock) shall be placed behind the block units unless otherwise specified by the manufacturer. Geotextile filter fabric shall be placed between the block and the backfill prior to backfilling.

Top cap blocks, if necessary) shall be adhered to the previous course with an approved construction adhesive or epoxy cement.

Retaining walls shall be protected from salt and the elements using a sealant from the MnDOT approved products list following the manufacturers recommend procedures.

Large Block Walls

These wall systems shall be constructed using ReCon Wall Systems, Inc., Redi-Rock Wall System,

Versa-Lok Bronco or approved equal. Large block walls shall be used for any publicly owned retaining walls more than four feet (4') exposed height.

Large block walls consist of wet cast concrete blocks with a final handling weight in excess of 1,000 pounds per full face unit, may utilize concrete reinforcing steel, have a maximum water/cement ratio of 0.45, slump from 1-8" and have a minimum 28-calendar day compressive strength of 4000 psi.

A Professional Engineer licensed by the State of Minnesota is required to prepare, sign and date the design calculations, shop drawings, and the wall system plans.

Blocks will have a surface texture on all exposed faces (including the exposed faces of the wall back and sides) matching a limestone rock surface or Engineer directed texture. Show proposed texture on the shop drawings for acceptance by the Engineer.

A single-color stain will be applied to all exposed faces (including the wall top and exposed portions of the wall back face). The color shall be a tan buff or otherwise approved by the Engineer. Contractor shall submit color samples prior to wall completion. Use sufficient material to provide color uniformity but avoid buildups and runs. Stain shall be 100 percent acrylic; water-repellant, semi-opaque, tinted emulsion sealer designed for concrete and masonry surfaces. Payment for applying stain will be included in payment for the wall system.

A large block wall specific preconstruction meeting shall be held at least 15 days before wall construction begins. The following should be included in the preconstruction meeting agenda; Safety items, sequence of construction, storage and handling of blocks, specifications, construction limits and any items needed to be resolved prior to construction.

Payment shall be made at the Contract unit price per square foot of wall units (both above and below ground), and shall be compensation in full for all labor, equipment and materials (including but not limited to; pins and miscellaneous hardware, coarse filter aggregate, backfill, foundations, geogrid reinforcement, drainage systems, etc.) required to construct the walls complete in place.

TREE MUST MEET OR EXCEED ANSI Z60.1 (AMERICAN STANDARD FOR NURSERY STOCK). ONE DOMINANT LEADER MUST BE MAINTAINED THROUGH THE WARRANTY PERIOD. REMOVE TAGS & LABELS.

DO NOT STAKE OR WRAP TRUNK UNLESS NECESSARY. IF STAKING IS NECESSARY, USE A WIDE FLEXIBLE STEM ATTACHMENT MATERIAL PLACED $\frac{1}{3}$ OR $\frac{2}{3}$ THE DISTANCE FROM THE GROUND UP TO THE FIRST SET OF BRANCHES. STAKING AND TRUNK WRAPPING MUST BE REMOVED AT THE END OF THE FIRST COMPLETE GROWING SEASON.

MULCH 4-6 INCHES DEEP LEAVING A 6-INCH CIRCLE OF BARE SOIL AROUND THE TRUNK OF THE TREE, PAST THE EDGE OF THE PLANTING HOLE

IF TREE IS PLANTED IN NATIVE SOILS IN GOOD CONDITION, RE-FILL PLANTING HOLE WITH EXCAVATED NATIVE SOIL MATERIAL.
IF TREE IS PLANTED IN POOR SOILS, RE-FILL PLANTING HOLE WITH A 50/50 MIX OF COMPOST AND NATIVE SOILS.

DIAMETER OF THE PLANTING HOLE SHALL BE TRIPLE THE DIAMETER OF THE ROOTBALL. IF AUGER IS USED TO DIG HOLES, SCARIFY THE SIDES OF THE HOLE WITH HAND TOOLS.

SIT SOILBALL ON UNDISTURBED OR COMPACTED SOIL TO PREVENT SETTLING

IMPERMEABLE LANDSCAPE MATERIAL SHALL NOT BE PLACED AROUND TREES

EACH TREE MUST BE PLANTED WITH THE FIRST MAIN LATERAL ROOT AT FINISH GRADE. TREES WITH THE FIRST MAIN LATERAL NOT VISIBLE WILL BE REJECTED

REMOVE EXCESS SOIL/ROOTS FROM THE SOILBALL TO EXPOSE THE FIRST MAIN LATERAL ROOT. PRUNE ALL ENCIRCLING ROOTS

IF B&B, REMOVE ALL TWINE AROUND THE STEM, ALL SYNTHETIC BURLAP MUST BE REMOVED. NON-SYNTHETIC BURLAP, IF PEELED BACK MUST BE REMOVED, NOT FOLDED DOWN. ASSURE WIRE BASKET DOES NOT PROTRUDE ABOVE FINAL GRADE.
